Passion Project: For The Family App

The Family Fun App is a mobile that allows the user to create family history and store family memories safely. The user is able to open the app, upload a photo, start a family tree, or do fun activities with the family. Recently we also added a journal portion for users to write how they feel and describe their emotions. Similarly, users are able to upload their handwritten notes and doodles. We believe this portion is valuable because we know that a picture is worth 1000 words but actual words have not lost their value. Being able to capture how someone felt in a traumatic event or a joyous occasion helps to keep the family thoughtful, sympathetic, and together.

Motto: Know your family, see your family, be a family.

Think About It:

Imagine not having to go years without knowing why your daughter became upset and grew depressed. Imagine understanding early that your Mother does love you, but everyday she lives in fear because of what happened to her brother in 2009. Imagine not having to take comfort in complete strangers over social media when you're subtweeting your family. Healing is possible. Loving your family is powerful. Use this app to uncover and discover beautiful possibilities.

My Minimum Viable Product:

My MVP will allow a user to do a family tree and add family photos.

What I'll Use To Do It:

I'll do it using Spring, Java, and React for the app.

Application Program Interfaces Being Used:

APIs: FamilyTree and Springer (simple journaling).
